By opting for turf, you chose a high quality product which allows the use of lawns in best time.

Surface Preparation

- Remove old sod, weeds and stones, prepare a levelled and compact surface
- Keep soil level approximately 2 cm below the surrounding grounds
- Apply 35 g/m^2 of lawn establishment fertiliser

Installation

- Turf should be installed immediately after delivery
- Lay turf rolls in a brickwork pattern
- Use a sharp knife to trim the edges of the sod to fit the landscape
- Roll sod with an 80 kg roller to ensure complete sod-to-soil contact
- Water thoroughly immediately after installation with approximately 20 l/m^2 (even after rainfall)

Maintenance

- Keep turf moist until the new grass is well rooted
- Mow grass carefully 2 weeks after installation at a height of 3.5 cm
- Further maintenance as usual

Fertilising

Our turf is fertilised before harvest and therefore carries plenty of nutrients for growing roots. Depending on the amount of nutrients in the soil below and the intended usage of the lawn, you should fertilise your lawn as follows:

- March - nitrogen fertiliser 25 g/m^2 as necessary
- April - long term fertiliser 15-9-15 (2) = 40 g/m^2
- June - nitrogen fertiliser 25 g/m^2 as necessary
- August - long term fertiliser 15-9-15 (2) = 40 g/m^2

Mowing

- Every 8 to 14 days at a height of 3,5 *cm*
